

Programacion orientada a objetos

Teacher´s name: Daniel Armando Rios Rivera
Student´s name: Daron Dominik Villanueva
Peña Date: 14/09/2026

```
// Clase general Vehículo
Clase Vehiculo
    Atributos:
        motor
        volante
        ruedas
        escape
        asientos

    Métodos:
        mover() -> "El vehículo se mueve hacia adelante y atrás"
        frenar() -> "El vehículo frena"
        girar() -> "El vehículo gira"

// Clase específica Combi que hereda de Vehículo
Clase Combi hereda Vehiculo
    Atributos propios:
        numeroAsientos
        color
        puertaLateral

    Constructor(motor, ruedas, volante, numeroAsientos, color)
        asignar motor
        asignar ruedas
        asignar volante
        asignar numeroAsientos
```

asignar color

Métodos propios:

abrirPuertaLateral() -> "La combi abre la puerta lateral"

cerrarPuertaLateral() -> "La combi cierra la puerta lateral"

transportarPasajeros() -> "La combi transporta pasajeros"

// Objeto concreto

Objeto MiCombi = nuevo Combi("Gasolina", 4, "Estándar", 12, "Blanco")

MiCombi.mover()

MiCombi.frenar()

MiCombi.abrirPuertaLateral()

MiCombi.transportarPasajeros()

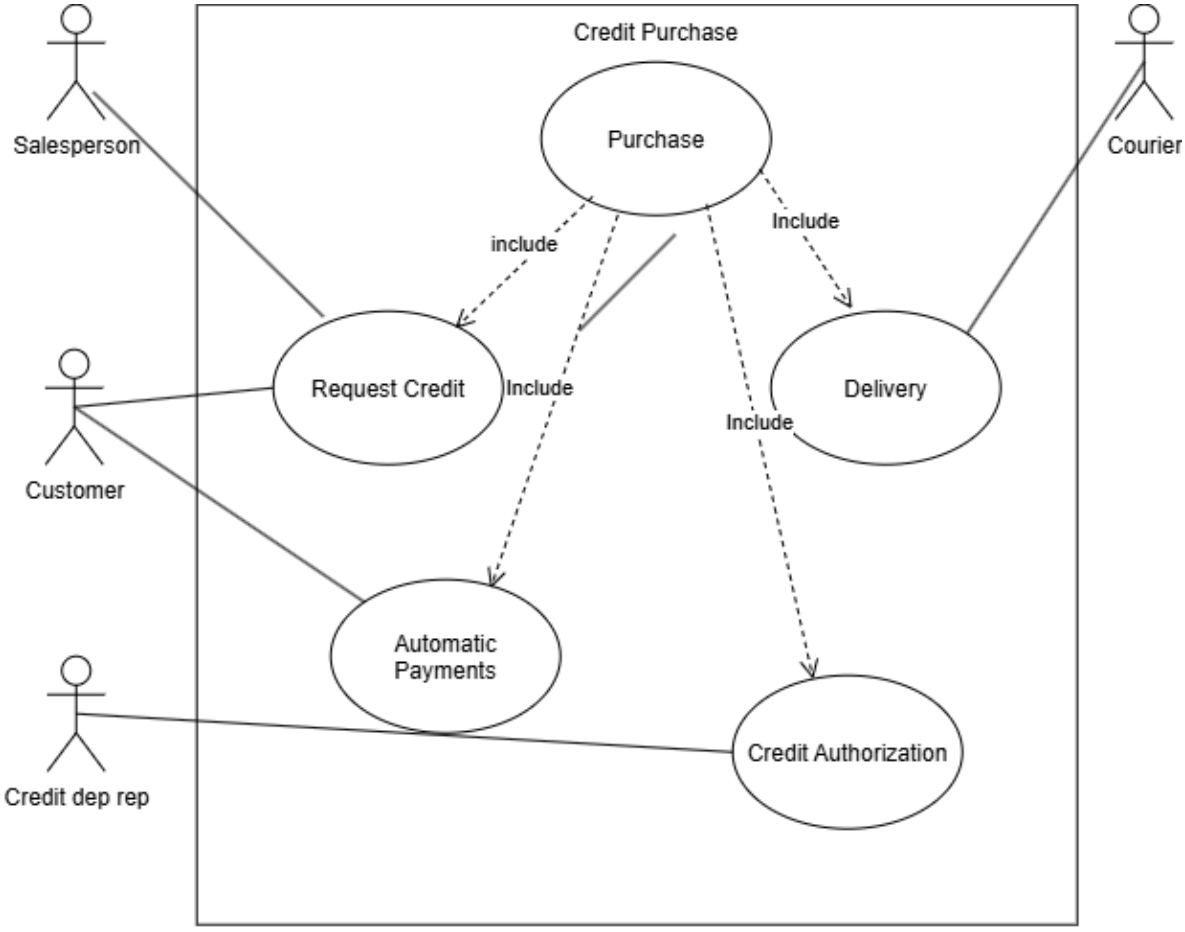

Observations and Conclusions:

This started was the theme that started the classes, basically we have class that is a placeholder for something and the beginning of everything, then we have the object that is the “running” (for calling it in a way) of a class and lastly, we have method.

Every piece is part of something bigger with attributes being the characteristics of an object and methods being the actions the object makes.

In this particular work the placeholder is “Vehiculo” with its attributes and methods assigned, then we have class being “combi” that inherits some of the attributes and methods from “vehiculo” and applies them and uses some proper methods and classes, Lastly this is the object “ensembled” (for calling it in a way).

- Diagramas de caso de uso (compra en línea)

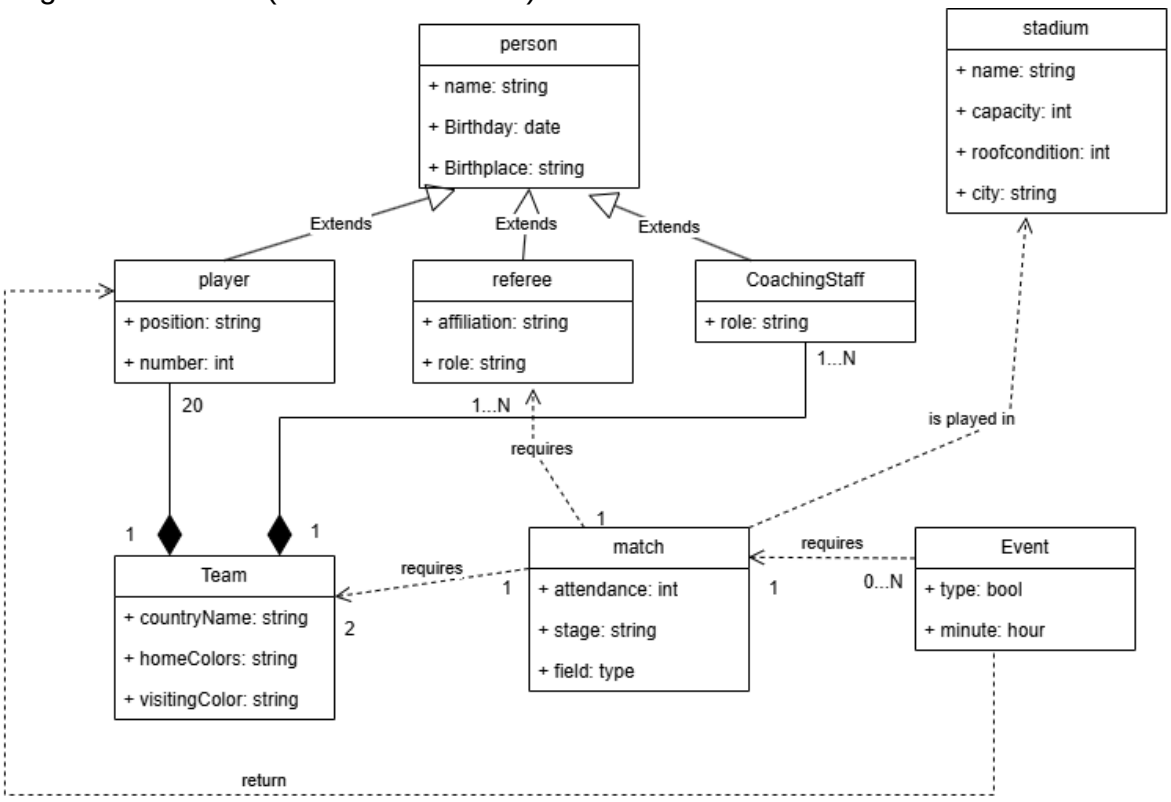

Observaciones y Conclusiones:

We have this diagram that shows the parts of a case use: we have the actors who play a role and where they make their role, inside we have the actions and how they expand to other areas (the line on the middle got set by mistake and I didn't notice until I exported it.

This got made in class by all the members of ITTID3.

- Diagrama de clase (Partidos de futbol)

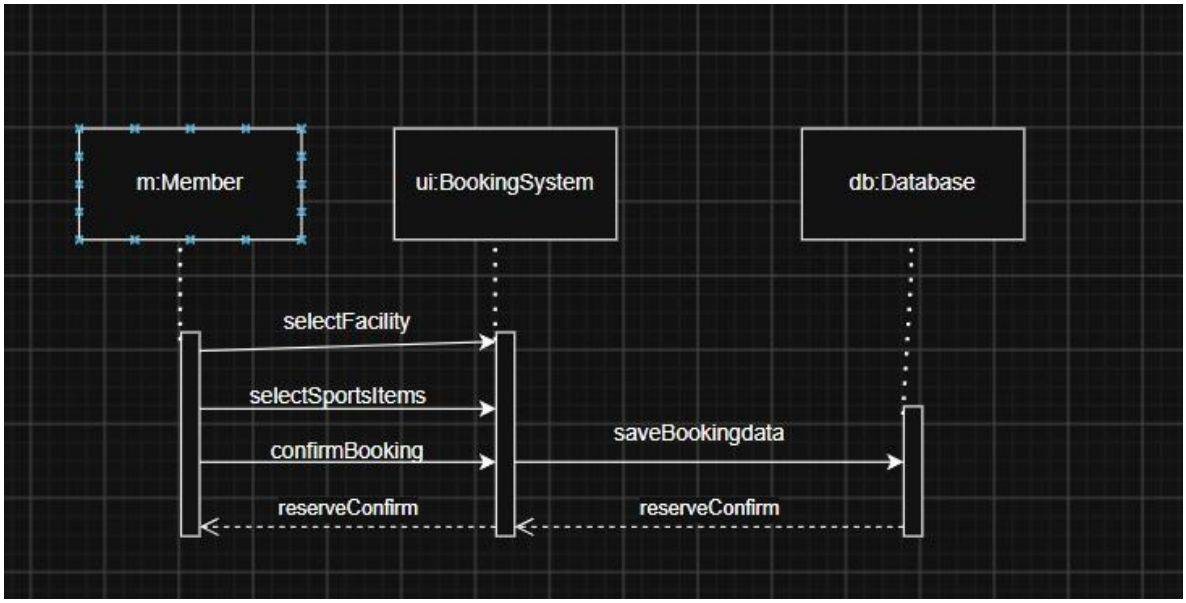

Observaciones y Conclusiones:

We have this diagram of classes, this dive more in depth to the attributes and methods shown in the first activity, now expanding to other places and categorizing it having more classes and subclasses than just one, adds some complexity by setting types of union with lines.

This can be seen as a conceptual map but complex, having things like “dependencies” and “compositions”.

This got made in class by all the members of ITTID3.

- Diagrama de secuencia (Renta de canchas)

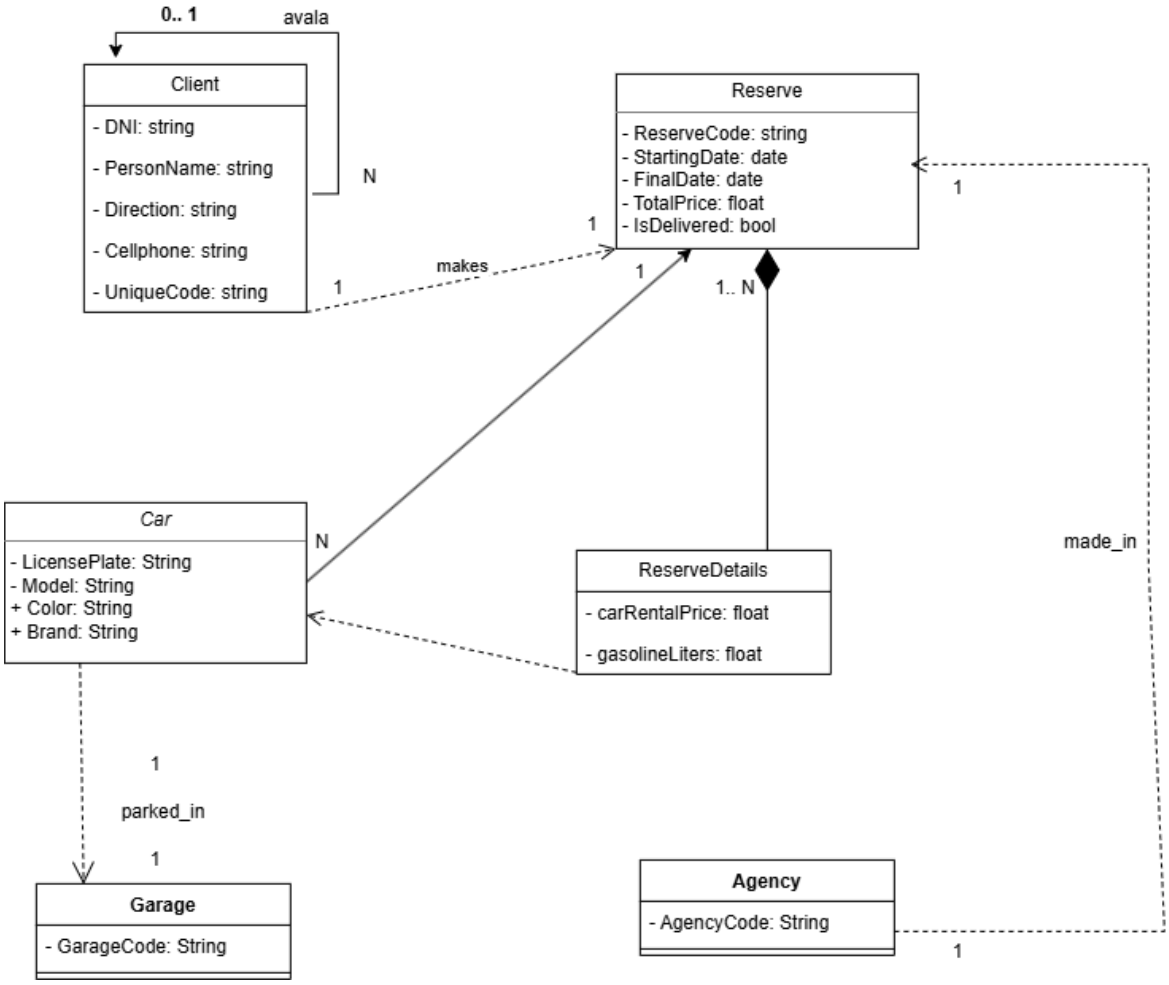

Observaciones y Conclusiones:

This is a simple sequence diagram, basically dictates the order of steps that our system does when is executed properly.

Nothing else to add.

- Diagrama de clase (Reserva de autos)

Observaciones y Conclusiones:

In this last work we have a diagram of class made by us, this was a challenge because me and my team debated what could be added or not, over all was a nice work.
